## TODO

- Table with info on target (main and reclass; emissions from NDC; target quantis + plot).
- GWP: NDC emissions converted from AR2 to AR4 by national conversion factor (2010–2017, PRIMAP-hist v2.1).
- References!

# 1 Emissions and socio-economic data

With national emissions of 4.0 Mt CO<sub>2</sub>eq, Liberia contributed 0.008% to global emissions in 2017, while in 2030 its share is estimated to increase to 0.01% (Table ??). The estimates for 2030 are based on the downscaled SSP2 Middle of the Road marker scenario (dmSSP2), in which Liberia is estimated to emit 7.7 Mt CO<sub>2</sub>eq in 2030. That change in emissions would constitute a substantial increase of 93.7% compared to 2017. The pathways dmSSP1–5 show a range of 7.7–12.7 Mt CO<sub>2</sub>eq in 2030, and 13.9–60.1 Mt CO<sub>2</sub>eq in 2050. The country’s global rank in terms of total emissions per unit of GDP was 19 in 2017, and 200 regarding the per-capita emissions (22 and 194 in 2030). In terms of accumulated historical emissions, Liberia contributed to the global 1850–2017 emissions by 0.006%. When only accounting for the years 1990–2017, its contribution stays the same to 0.006%. All of the emissions are presented following GWP AR4, and exclude emissions from LULUCF (exclLU), and bunkers fuels emissions (exclBunkers).

Table 1: National emissions (dmSSP2), GDP and population for Liberia, together with the emissions per unit of GDP and per capita emissions (all for 2017 and 2030). Additionally, the global share and its rank are displayed.

	Year	Total	Unit	Glob. share	Rank
<b>Emissions</b>	2017	4.0	Mt CO <sub>2</sub> eq	0.008%	159
	2030	7.7	Mt CO <sub>2</sub> eq	0.01%	153
<b>GDP</b>	2017	4.0	Billion 2011 GK\$	0.003%	168
	2030	12.6	Billion 2011 GK\$	0.007%	161
<b>Emissions per GDP</b>	2017	1.0	t CO <sub>2</sub> eq / Thousand 2011 GK\$	0.9%	19
	2030	0.6	t CO <sub>2</sub> eq / Thousand 2011 GK\$	0.8%	22
<b>Population</b>	2017	4.7	Million Pers	0.06%	122
	2030	6.9	Million Pers	0.08%	110
<b>Emissions per capita</b>	2017	0.8	t CO <sub>2</sub> eq / Pers	0.05%	200
	2030	1.1	t CO <sub>2</sub> eq / Pers	0.07%	194

For Liberia, in 2017 the main emissions share on sectoral level (Fig. ??) came from the Energy sector (61.3%), followed by Waste (20.4%) The Kyoto GHG with the highest emissions in 2017 was CH<sub>4</sub>, constituting 55.4% of the national emissions. Second largest contributor was CO<sub>2</sub> (30.7%) The total of F-gases only represented 1.1%. The trend in total emissions is mostly driven by CH<sub>4</sub> emissions from the Energy sector, which contributed 30.0% to Liberia’s 2017 emissions.<sup>1</sup> The total CO<sub>2</sub> emissions are expected to be 40.0% of the national Kyoto GHG emissions in 2030 (dmSSP2).

<sup>1</sup>Analysis based on the correlations between total national emissions (exclLU) versus the emissions of the combinations of main-sectors & the gases CO<sub>2</sub>, CH<sub>4</sub>, N<sub>2</sub>O and F-gases. Only data from 2010 to 2017 are assessed. The (up to) three gas & sector combinations are chosen for which the slope of the regression line to the correlated values exceeds 0.2.

Figure 1: 'Stacked' timeseries of national emissions (exclLU) per main-sector (a) and Kyoto GHG (b). No information available on the sectoral contributions after 2017.

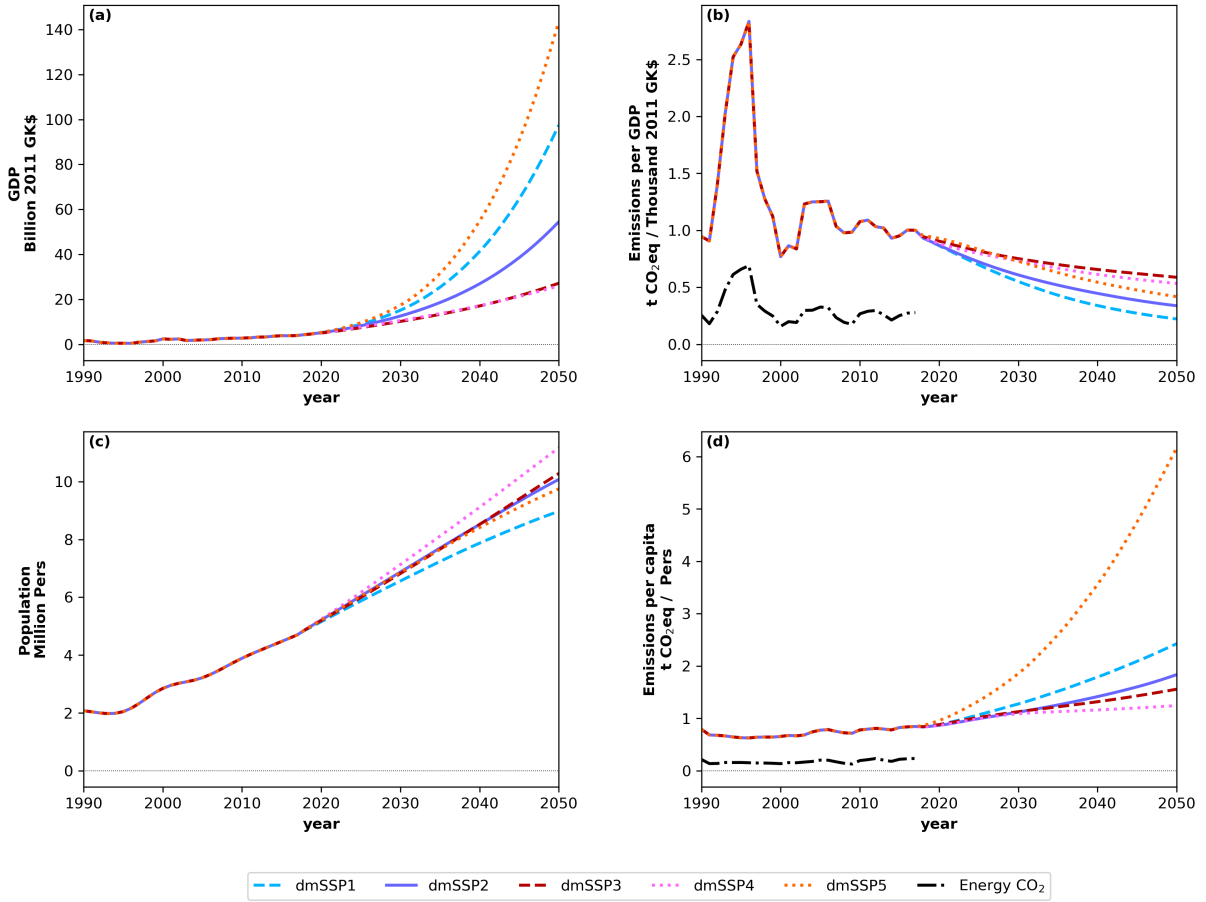

Figure 2: Timeseries of national GDP (a) and population (c), and Kyoto GHG emissions (exclLU, exclBunkers) per unit of GDP (b) or per capita (d).

The national GDP increased in recent years, and the emissions per unit of GDP had an opposite trend (Fig. ??). The population increased, and the per capita emissions dropped. Following dmSSP2, the GDP is projected to increase towards 2050. The emissions per GDP are estimated to decrease towards 2050. Liberia's population is assumed to grow towards 2050, and the per capita emissions are expected to increase towards 2050.

LULUCF emissions data for Liberia are available from the following sources (Fig. ??): FAO (2019) / 28, with the number of available data points in 1990–2017 displayed additionally. Based on data from FAO (2019), for the year 2017, LULUCF is estimated to be a net source of 4.6 Mt CO<sub>2</sub>eq, which in absolute terms is higher than the non-LULUCF emissions of 4.0 Mt CO<sub>2</sub>eq. The large emissions range for FAO (2019) and 1990–2017 is 1.6–20.1 Mt CO<sub>2</sub>eq.

Figure 3: Timeseries of emissions from LULUCF (CO<sub>2</sub> plus CH<sub>4</sub> and N<sub>2</sub>O) as available from different data-sources. Indicated in pink are the 'chosen' data, as used in our assessment of Liberia's NDC (if needed). The pink timeseries was inter- and / or extrapolated (interpolation: linear, extrapolation: constant).

## 2 Mitigation targets (NDC)

Give the %cov for the base and target year (and 2017).

Global share for 2030 for the mitigated pathways and % reduction relative to 1990 and 2017.

Table with the 'input' data and the resulting targets (like `ndcs_targets.csv`).

Liberia has an NDC, with a GHG mitigation target of the type RBU (relative reduction compared to Business-As-Usual; main target type). The reclassified target type is ABU (absolute reduction compared to Business-As-Usual).

Table 2: Information on Liberia's GHG mitigation target(s).

type	condi.	range	value	tarYr	LU
ABU	condi.	best	-0.79 Mt CO <sub>2</sub> eq	2030	exclLU
RBU	condi.	worst	-10%	2030	exclLU
RBU	condi.	best	-15%	2030	exclLU

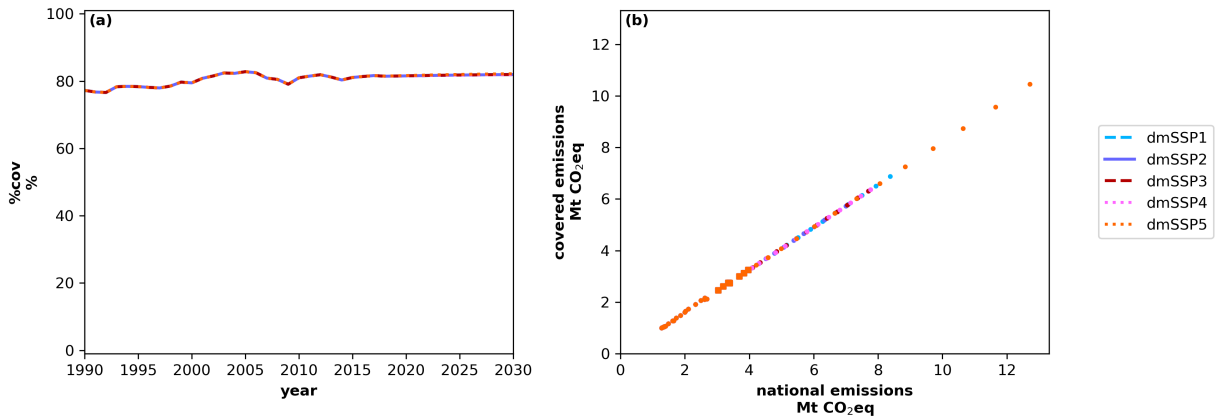

Figure 4: Timeseries of Liberia's national emissions (exclLU) and the share of emissions that is assumed to be covered by Liberia's mitigation target.

Table 3: Information on covered sectors and gases as retrieved from NDC and adapted ('Adap.': used to calculate %cov), and their shares in Liberia's 2017 emissions (exclLU, exclBunkers; total 4.0 Mt CO<sub>2</sub>eq). If either the sector or gas is assessed as 'not-covered', the emissions from this sector-gas combination are counted as not-covered (-). Else the emissions are counted as covered (+; covered shares given in bold). (/) means that no information is available. LULUCF: NDC '/' and adapted '-' (estimated as a net source of 4.6 Mt CO<sub>2</sub>eq in 2017; based on the 'chosen' LULUCF emissions).

	NDCs	Adap.	CO <sub>2</sub>	CH <sub>4</sub>	N <sub>2</sub> O	HFCs	PFCs	SF <sub>6</sub>	NF <sub>3</sub>	Total
NDCs			+	+	+	/	/	/	/	
Adap.			+	+	+	-	-	-	-	
Energy	+	+	<b>27.8%</b>	<b>30.0%</b>	<b>3.4%</b>	/	/	/	/	61.3%
IPPU	/	-	2.9%	/	0.0%	1.1%	/	/	/	4.0%
Agri.	/	-	/	5.8%	6.8%	/	/	/	/	12.6%
Waste	+	+	/	<b>19.6%</b>	<b>0.8%</b>	/	/	/	/	20.4%
Other	/	-	/	/	1.8%	/	/	/	/	1.8%
Total			30.7%	55.4%	12.8%	1.1%	/	/	/	100.0%

Figure 5: Quantified mitigation targets (based on different input data and calculation options). Vertical lines: conditionality / range; colour coded: dmSSP1–5; first / second set of six: prio NDCs / SSPs; set of six: coverage 100, lulucf unfccc, lulucf fao, bl uncondi, const emi, estimated coverage.

### 3 Data sources, additional information and references

**PRIMAP-hist v2.1:** emissions from PRIMAP-hist are data from the country reported data priority scenario (HISTCR).

**dmSSPs:** emissions, population and GDP data are PMSSPBIE data for the five marker scenarios.

**SSPs** Shared Socio-economic Pathways.

Narratives and challenges to mitigation and adaptation:

*SSP1*: Sustainability, Taking the Green Road (low / low);

*SSP2*: Middle of the Road (medium / medium);

*SSP3*: Regional Rivalry, A Rocky Road (high / high);

*SSP4*: Inequality, A Road Divided (low / high); and

*SSP5*: Fossil-fuelled Development, Taking the Highway (high / low).

**GDP** Gross Domestic Product.

Throughout this document the GDP is given as GDP PPP, with PPP being the Purchasing Power Parity.

**GWP** Global Warming Potential.

We use GWP values from the IPCC 4<sup>th</sup> Assessment Report (AR4). They reflect the forcing potential of one kilogram of a gas' emissions in comparison to one kilogram of CO<sub>2</sub> (GWP<sub>CO2</sub> = 1). The GWPs correspond to a 100-yr period and are for CH<sub>4</sub>: 25, for N<sub>2</sub>O: 298, for SF<sub>6</sub>: 22800, and for NF<sub>3</sub>: 17200. For the basket of HFC-gases the GWPs from AR4 are in the range 4–14800, and for PFCs 7190–12200. To assess emissions of several GHGs, their emissions are weighted by their respective GWPs and presented in CO<sub>2</sub> equivalents (CO<sub>2</sub>eq).

**LULUCF** Land Use, Land-Use Change and Forestry.

Emissions from LULUCF are excluded throughout the document, unless stated otherwise.

**Bunkers fuels** Emissions from international aviation and shipping.

**Kyoto GHG** Kyoto GHG (Greenhouse Gas) basket.

Carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), nitrous oxide (N<sub>2</sub>O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF<sub>6</sub>), and nitrogen trifluoride (NF<sub>3</sub>).

**F-gases** Fluorinated gases.

Basket of HFCs, PFCs, and the gases SF<sub>6</sub> and NF<sub>3</sub>. Some F-gases have very long atmospheric lifetimes and high Global Warming Potentials.

**Target reclassification** When a country has, e.g., an RBU target (relative reduction compared to Business-As-Usual), and the BAU emissions are provided, it can be quantified based on the given emissions, and is reclassified from type\_main RBU to type\_reclass ABS (absolute emissions target). Additionally, 'NGT' targets can be reclassified as 'ABU' (absolute reduction compared to Business-As-Usual) if absolute mitigation effects due to planned policies and measures are provided.

**Quantification options** Different quantification options were tested.

*dmSSP1–5*: down-scaled SSP marker scenarios;

*type\_reclass*: external data prioritised (PRIMAP-hist, dmSSPs);

*type\_main*: emissions data from within NDCs were prioritised;

*100% coverage* & *estimated coverage*;

*constant emi*: constant emissions after last target year (instead of constant relative difference to baseline);  
*baseline uncondi*: baseline emissions as uncond. pathways for Parties without uncond. targets, even if baseline is better than cond. targets (instead of cond. pathway as uncond. pathways in these cases).
