#### TODO

- Table with info on target (main and reclass; emissions from NDC; target quantis + plot).
- GWP: NDC emissions coverted from AR2 to AR4 by national conversion factor (2010–2017, PRIMAP-hist v2.1).
- References!

### 1 Emissions and socio-economic data

With national emissions of 0.9 Gt CO<sub>2</sub>eq, Indonesia contributed 1.9% to global emissions in 2017, while in 2030 its share is estimated to increase to 2.2% (Table 1). The estimates for 2030 are based on the downscaled SSP2 Middle of the Road marker scenario (dmSSP2), in which Indonesia is estimated to emit 1.3 Gt CO<sub>2</sub>eq in 2030. That change in emissions would constitute a substantial increase of 40.9% compared to 2017. The pathways dmSSP1–5 show a range of 1.2–1.4 Gt CO<sub>2</sub>eq in 2030, and 1.8–2.9 Gt CO<sub>2</sub>eq in 2050. The country's global rank in terms of total emissions per unit of GDP was 132 in 2017, and 125 regarding the per-capita emissions (153 and 115 in 2030). In terms of accumulated historical emissions, Indonesia contributed to the global 1850–2017 emissions by 1.2%. When only accounting for the years 1990–2017, its contribution increases to 1.6%. All of the emissions are presented following GWP AR4, and exclude emissions from LULUCF (exclLU), and bunkers fuels emissions (exclBunkers).

Table 1: National emissions (dmSSP2), GDP and population for Indonesia, together with the emissions per unit of GDP and per capita emissions (all for 2017 and 2030). Additionally, the global share and its rank are displayed.

|            | Year | Total | Unit                                     | Glob. share | Rank |
|------------|------|-------|--|-------------|------|
| Emissions  | 2017 | 0.9   | Gt CO <sub>2</sub> eq                    | 1.9%        | 9    |
|            | 2030 | 1.3   | $Gt CO_2eq$                              | 2.2%        | 6    |
| GDP        | 2017 | 2.8   | Trillion 2011 GK\$                       | 2.5%        | 8    |
|            | 2030 | 5.9   | Trillion 2011 GK\$                       | 3.3%        | 4    |
| Emissions  | 2017 | 320.8 | t CO <sub>2</sub> eq / Million 2011 GK\$ | 0.2%        | 132  |
| per GDP    | 2030 | 212.4 | t $CO_2eq$ / Million 2011 GK\$           | 0.2%        | 153  |
| Population | 2017 | 264.7 | Million Pers                             | 3.5%        | 4    |
|            | 2030 | 287.1 | Million Pers                             | 3.4%        | 4    |
| Emissions  | 2017 | 3.4   | t CO <sub>2</sub> eq / Pers              | 0.2%        | 125  |
| per capita | 2030 | 4.4   | t CO <sub>2</sub> eq / Pers              | 0.2%        | 115  |

For Indonesia, in 2017 the main emissions share on sectoral level (Fig. 1) came from the Energy sector (63.7%), followed by Waste (15.3%) The Kyoto GHG with the highest emissions in 2017 was CO<sub>2</sub>, constituting 67.0% of the national emissions. Second largest contributor was CH<sub>4</sub> (25.9%) The total of F-gasesonly represented 0.0%. The total CO<sub>2</sub> emissions are expected to be 68.6% of the national Kyoto GHG emissions in 2030 (dmSSP2).

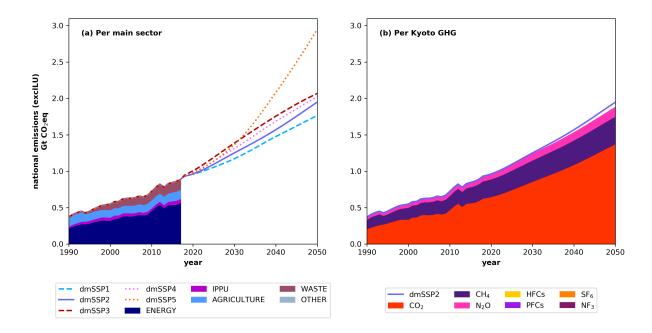

Figure 1: 'Stacked' timeseries of national emissions (exclLU) per main-sector (a) and Kyoto GHG (b). No information available on the sectoral contributions after 2017.

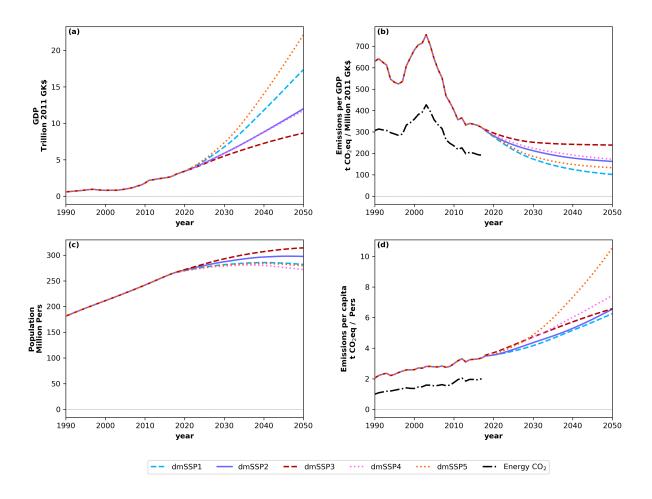

Figure 2: Timeseries of national GDP (a) and population (c), and Kyoto GHG emissions (exclLU, exclBunkers) per unit of GDP (b) or per capita (d).

The national GDP increased in recent years, and the emissions per unit of GDP had an opposite trend (Fig. 2). The population increased, and the per capita emissions dropped. Following dmSSP2, the GDP is projected to increase towards 2050. The emissions per GDP are estimated to decrease towars 2050. Indonesia's population is assumed to grow after 2017 but to diminish again before 2050, and the per capita emissions are expected to increase towards 2050.

LULUCF emissions data for Indonesia are available from the following sources (Fig. 3): BUR  $(2^{nd})$  / 17, BUR  $(1^{st})$  / 13, UNFCCC (2019) / 6, FAO (2019) / 28, with the number of available data points in 1990–2017 displayed additionally. Based on data from UNFCCC (2019), for the year 2017, LULUCF is estimated to be a net source of 0.8 Gt CO<sub>2</sub>eq, which in absolute terms is in the range of the non-LULUCF emissions of 0.9 Gt CO<sub>2</sub>eq. The large emissions range for UNFCCC (2019) and 1990-2017 is 0.3-1.6 Gt CO<sub>2</sub>eq.

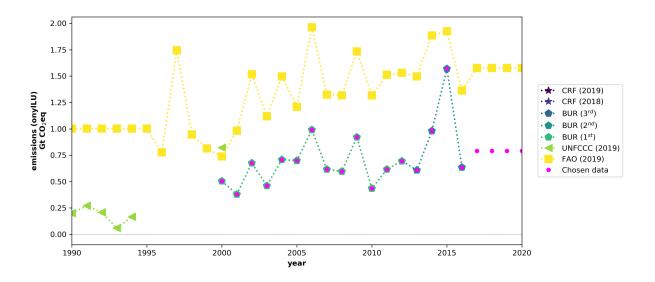

Figure 3: Timeseries of emissions from LULUCF ( $\rm CO_2$  plus  $\rm CH_4$  and  $\rm N_2O$ ) as available from different data-sources. Indicated in pink are the 'chosen' data, as used in our assessment of Indonesia's NDC (if needed). The pink timeseries was inter- and / or extrapolated (interpolation: linear, extrapolation: constant).

# 2 Mitigation targets (NDC)

Give the %cov for the base and target year (and 2017).

Global share for 2030 for the mitigated pathways and % reduction relative to 1990 and 2017.

Table with the 'input' data and the resulting targets (like ndcs\_targets.csv).

Indonesia has an NDC, with a GHG mitigation target of the type RBU (relative reduction compared to Business-As-Usual; main target type). The reclassified target type is ABS (absolute emissions target).

Table 2: Information on Indonesia's GHG mitigation target(s).

| type | condi.   | range | value                                  | tarYr | LU     |
|------|----------|-------|--|-------|--------|
| ABS  | uncondi. | best  | $1817 \text{ Mt CO}_2\text{eq AR4}$    | 2030  | exclLU |
| ABS  | condi.   | worst | $1723 \text{ Mt CO}_2\text{eq AR4}$    | 2030  | exclLU |
| ABS  | condi.   | best  | $1675.85 \text{ Mt CO}_2\text{eq AR4}$ | 2030  | exclLU |
| ABS  | uncondi. | best  | $2034 \text{ Mt CO}_2\text{eq AR4}$    | 2030  | inclLU |
| ABS  | condi.   | worst | $1788 \text{ Mt CO}_2\text{eq AR4}$    | 2030  | inclLU |
| ABS  | condi.   | best  | $1692.71 \text{ Mt CO}_2\text{eq AR4}$ | 2030  | inclLU |
| RBU  | uncondi. | best  | -15.6%                                 | 2030  | exclLU |
| RBU  | condi.   | worst | -19.0%                                 | 2030  | exclLU |
| RBU  | condi.   | best  | -20.0%                                 | 2030  | exclLU |
| RBU  | uncondi. | best  | -29%                                   | 2030  | inclLU |
| RBU  | condi.   | worst | -38.24%                                | 2030  | inclLU |
| RBU  | condi.   | best  | -41%                                   | 2030  | inclLU |

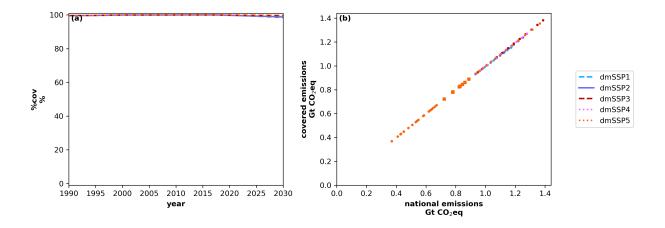

Figure 4: Timeseries of Indonesia's national emissions (exclLU) and the share of emissions that is assumed to be covered by Indonesia's mitigation target.

Table 3: Information on covered sectors and gases as retrieved from NDC and adapted ('Adap.': used to calculate %cov), and their shares in Indonesia's 2017 emissions (exclLU, exclBunkers; total 0.9 Gt CO<sub>2</sub>eq). If either the sector or gas is assessed as 'not-covered', the emissions from this sector-gas combination are counted as not-covered (–). Else the emissions are counted as covered (+; covered shares given in bold). (/) means that no information is available. LULUCF: NDC '+' and adapted '+' (estimated as a net source of 0.8 Gt CO<sub>2</sub>eq in 2017; based on the 'chosen' LULUCF emissions).

|                  | NDCs | Adap. | $\mathbf{CO}_2$ | $\mathbf{CH}_4$ | $N_2O$       | HFCs | PFCs | $\mathbf{SF}_6$ | $\mathbf{NF}_3$ | Total  |
|------------------|------|-------|-----------------|-----------------|--------------|------|------|-----------------|-----------------|--------|
| NDCs             |      |       | +               | +               | +            | /    | /    | /               | /               |        |
| Adap.            |      |       | +               | +               | +            | _    | _    | _               | _               |        |
| Energy           | +    | +     | 59.6%           | 3.5%            | 0.6%         | /    | /    | /               | /               | 63.7%  |
| $\mathbf{IPPU}$  | +    | +     | 6.3%            | 0.0%            | 0.1%         | /    | 0.0% | 0.0%            | /               | 6.5%   |

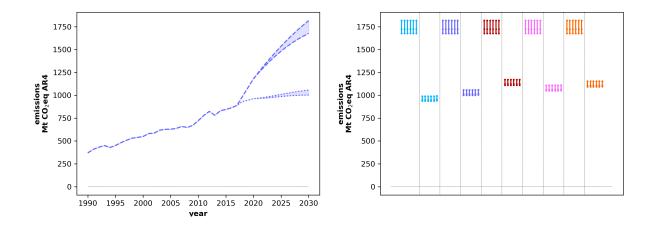

Figure 5: Quantified mitigation targets (based on different input data and calculation options). Vertical lines: conditionality / range; colour coded: dmSSP1–5; first / second set of six: prio NDCs / SSPs; set of six: coverage 100, lulucf unfccc, lulucf fao, bl uncondi, const emi, estimated coverage.

## 3 Data sources, additional information and references

PRIMAP-hist v2.1: emissions from PRIMAP-hist are data from the country reported data priority scenario (HISTCR).

dmSSPs: emissions, population and GDP data are PMSSPBIE data for the five marker scenarios.

#### SSPs Shared Socio-economic Pathways.

Narratives and challenges to mitigation and adaptation:

SSP1: Sustainability, Taking the Green Road (low / low);

SSP2: Middle of the Road (medium / medium);

SSP3: Regional Rivalry, A Rocky Road (high / high);

SSP4: Inequality, A Road Divided (low / high); and

SSP5: Fossil-fuelled Development, Taking the Highway (high / low).

#### **GDP** Gross Domestic Product.

Throughout this document the GDP is given as GDP PPP, with PPP being the Purchasing Power Parity.

#### **GWP** Global Warming Potential.

We use GWP values from the IPCC  $4^{th}$  Assessment Report (AR4). They reflect the forcing potential of one kilogram of a gas' emissions in comparison to one kilogram of  $CO_2$  (GWP<sub>CO2</sub> = 1). The GWPs correspond to a 100-yr period and are for CH<sub>4</sub>: 25, for N<sub>2</sub>O: 298, for SF<sub>6</sub>: 22800, and for NF<sub>3</sub>: 17200. For the basket of HFC-gases the GWPs from AR4 are in the range 4–14800, and for PFCs 7190–12200. To assess emissions of several GHGs, their emissions are weighted by their respective GWPs and presented in  $CO_2$  equivalents ( $CO_2$ eq).

#### **LULUCF** Land Use, Land-Use Change and Forestry.

Emissions from LULUCF are excluded throughout the document, unless stated otherwise.

**Bunkers fuels** Emissions from international aviation and shipping.

#### Kyoto GHG (Greenhouse Gas) basket.

Carbon dioxide  $(CO_2)$ , methane  $(CH_4)$ , nitrous oxide  $(N_2O)$ , hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride  $(SF_6)$ , and nitrogen trifluoride  $(NF_3)$ .

#### F-gases Fluorinated gases.

Basket of HFCs, PFCs, and the gases SF<sub>6</sub> and NF<sub>3</sub>. Some F-gases have very long atmospheric lifetimes and high Global Warming Potentials.

Target reclassification When a country has, e.g., an RBU target (relative reduction compared to Business-As-Usual), and the BAU emissions are provided, it can be quantified based on the given emissions, and is reclassified from type\_main RBU to type\_reclass ABS (absolute emissions target). Additionally, 'NGT' targets can be reclassified as 'ABU' (absolute reduction compared to Business-As-Usual) if absolute mitigation effects due to planned policies and measures are provided.

#### Quantification options Different quantification options were tested.

dmSSP1-5: down-scaled SSP marker scenarios;

type\_reclass: external data prioritised (PRIMAP-hist, dmSSPs);

type\_main: emissions data from within NDCs were prioritised;

100% coverage & estimated coverage;

constant emi: constant emissions after last target year (instead of constant relative difference to baseline);

baseline uncondi: baseline emissions as uncond. pathways for Parties without uncond. targets, even if baseline is better than cond. targets (instead of cond. pathway as uncond. pathways in these cases).
